

Gulf Ethanol Unveils New Technology

Gulf Ethanol Corporation, (PinkSheets: GFET) unveils its new biomass reduction technology. The cellulosic preprocessing system unveiled by GFET, today, was designed to reduce sorghum and other biomass into a fine powder that can be processed into ethanol more efficiently. Feedstock pre-processing is a key step toward efficient cellulosic ethanol production

U.S. energy consumption is expected to grow over 18 percent by 2030. Cellulosic ethanol, made from non-food feedstock, is expected to play a significant role in the diversification our nation's energy sources as a key solution to help meet our growing demand for energy.

GFET's technology demonstrates the efficiency of cellulosic materials as the basic feedstock for ethanol production. The success of this project can place Gulf Ethanol in a leading role as a provider of ethanol production technology. Gulf Ethanol holds the exclusive, worldwide, distribution rights to this system.

- Today, on a life cycle basis, ethanol produced from corn results in about a 20 percent reduction in Green House Gas emissions relative to gasoline. With improved efficiency and use of renewable energy, this reduction could be as much as 52 percent.
- In the future, ethanol produced from cellulose has the potential to cut life cycle GHG emissions by up to 86 percent relative to gasoline.
- Ethanol blended fuels currently in the market – whether E10 or E85 – meet stringent tailpipe emission standards.
- Ethanol readily biodegrades without harm to the environment, and is a safe, high-performance replacement for fuel additives such as MTBE.
